

LxI 7.1

1. The development environment I use now a days are:

- **Visual Studio Code (VS Code)** – my main IDE for coding, debugging, and managing projects.
- **Jupyter Notebook** – for building and experimenting with machine learning models and performing data analysis.
- **Windows Subsystem for Linux (WSL)** – to work in a Linux environment directly on my Windows system for smoother package management and command-line operations.
- **Git + GitHub** – for version control and collaboration on projects.
- **Google Colab** – cloud-based notebook environment with free GPU access.
- **Kaggle Notebooks** – similar to Colab, often used for ML experiments and competitions.
- **Postman** – for API testing and backend debugging.
