

Lxl 1.1

Answer 1:

I have chosen IRCTC as a software service.

Component 1: Payment Gateway

- This component manages secure online transactions for booking tickets. It integrates with multiple banks, UPI, wallets, and different credit and debit card services to make and process payments. It also ensures encryption, fraud detection, and transaction confirmation to maintain trust and reliability.

Component 2: User Profile Management

- This component stores and manages user information such as personal details, saved passenger lists, and booking history. It makes future bookings faster as it also stores the preferred payment methods.

Interaction:

- When a user initiates a ticket booking, the User Profile Management component provides stored passenger and payment details to streamline the process. Once the user proceeds to payment. The Payment Gateway securely processes the transaction and updates the booking confirmation. In turn, the profile management component records the new booking in the user's history as per the transaction status, making it accessible for future reference, cancellations, or raising a query.

Answer 2:

I like the post made by **22f1001637** because it is clear, structured, and easy to follow. The components are described in detail with practical examples, which makes it simple to understand how Zomato works behind the scenes. I also like how the interaction part connects the two components meaningfully, showing how real-time tracking and recommendations can complement each other. It not only explains the technical side but also highlights the impact on user experience, which makes the answer more insightful.

Answer 3:

I have not particularly responded to any posts but I gave likes to few of them based on their response.
