

Lxl 2.1

Answer 1:

I have chosen the problem - “Managing attendance and leave tracking in offices”. Currently, many small and medium-sized organizations still use registers and manual spreadsheets, which are prone to errors and time-consuming. A software solution can make this process more efficient.

Answer 2:

I will use a combination of interviews, questionnaires/surveys, and observation.

- Interviews: Talk with employees, HR, and members to understand their problems.
- Questionnaire: To gather inputs from larger groups.
- Observation: To see how attendance is currently being tracked and where the delays/errors are happening.

Answer 3:

Employees:

- How do you currently mark your attendance and apply for leave?
- What challenges do you face with the current system?

HR:

- How do you track attendance and manage leave requests in the current system?
- What kind of reports do you need most often?
- How important is the integration with the payroll system and salary management?

Senior Managers:

- What kind of reports do you want from the system?
- How frequently do you want these reports?
- Do you also require other features like late arrival or overtime logging?

Answer 4:

I liked the post made by Ayush (21f3000836) where he explained the chosen problem and components in a very clear and structured way. The reason I liked it most is because he not only described the users and requirement gathering techniques well but also gave practical examples that made it easy to understand how the solution would actually work. His interaction part also showed how different stakeholders benefit together, which made the post more insightful and relatable.

Answer 5:

I have replied to 2 posts:

- Mental wellness mobile app. (21f3000836)
- Smart waste management system (23f1000032)
